

Bundled Observability — solution brief

Production-grade observability bundled into the platform — logs, metrics, traces, SLOs with burn-rate alerts, synthetics and usage metering — without a separate observability contract.

Logs, metrics, traces and SLOs — in the licence.

September 2026 · Version 1.0 · www.bluewhalestack.com

Production-grade observability bundled into the platform — logs, metrics, traces, SLOs with burn-rate alerts, synthetics and usage metering — without a separate observability contract.

Bundled Observability brings logs, metrics and traces into the same control plane as your inventory, so every signal resolves to a workload and an owner. SRE and operations teams define SLOs, alert on error-budget burn rate rather than static thresholds, probe endpoints synthetically, and open ITSM incidents automatically — all included in the Standard and Enterprise licence rather than procured as a separate monitoring contract.

Included	Burn rate	In-region
In the Standard and Enterprise licence — no separate observability contract	Alerting on error budgets, not raw thresholds	Telemetry stays in the deployment's region or perimeter

The challenge

Observability is usually a separate, expensive contract bolted onto the cloud platform, with its own identity, data and alerting to maintain.

How it shows up

- A second identity system and a second bill for the monitoring tool.
- Alerts fire on thresholds, so on-call is paged for noise and misses slow burns.
- Telemetry and inventory disagree about what a service is, so incidents lose time on 'which host is this'.

How it works

- Step 1**
Telemetry — logs, metrics and traces — is ingested from cloud services, OpenTelemetry agents and the Edge Agent.
- Step 2**
Signals are correlated to inventory, so each one resolves to a workload and an owner.
- Step 3**
SLOs are defined per service; alerts fire on error-budget burn rate; synthetics probe critical paths.
- Step 4**
Breaches open ITSM incidents automatically and route to the owning team.
- Step 5**
Usage metering feeds Whalenomics and Tenancy for cost and billing.

What is included

- Logs, metrics & traces in one place, correlated to the inventory
- SLOs with burn-rate alerting
- Synthetics & usage metering
- Notification channels & automatic ITSM incidents

Modules involved

Observe Production APM — logs, metrics, traces & SLOs, bundled.	ITSM Cloud-ops-native incident, change & problem management.
Inventory & Discovery A live, unified map of every asset — across every cloud and on-prem.	

Editions and audience

Recommended editions: Enterprise and Telco & Datacenter.

Who it is for: SRE, platform and operations teams who want observability inside the control plane.

Questions teams ask in the evaluation

01 Can we keep our current APM tool during a transition?

Yes. Its alerts can open incidents in the platform through webhooks while you move dashboards and SLOs across at your own pace.

02 How do you keep alert noise down?

Alerts are based on SLO error-budget burn rate and correlated to workloads, so one real problem produces one incident routed to its owner.

03 Where is telemetry stored?

In the deployment's region on SaaS, in your accounts on BYOC, and inside the perimeter on sovereign or air-gapped deployments.
