

## SOLUTION BRIEF

# Cloud Migration — solution brief

Auto-classify on-prem workloads and run a 6R assessment with cost, effort and blocker analysis, then plan by wave and workload — with Whale AI guidance. Assessment is live today.

**Scored, sequenced, rehearsed.**

September 2026 · Version 1.0 · [www.bluewhalestack.com](http://www.bluewhalestack.com)

Auto-classify on-prem workloads and run a 6R assessment with cost, effort and blocker analysis, then plan by wave and workload — with Whale AI guidance. Assessment is live today.

**Cloud Migration turns a datacenter exit or a regulator's exit-plan requirement into a costed, sequenced programme. Workloads discovered by the Edge Agent are classified, scored with a 6R assessment for cost, effort and blockers, and cut into dependency-aware waves with rollback plans. Assessment and wave planning are live; execution hooks that hand the move to tooling and track it back are in progress.**

**6R**

Rehost · replatform · refactor ·  
repurchase · retire · retain — scored  
per workload

**Live**

Assessment and wave planning;  
execution hooks in progress

**Any target**

Six public clouds, private platforms  
via Edge Agent, or repatriation

**The challenge**

Migrations stall because nobody has a clear, costed view of which workloads to move, in what order, and what will block them.

## How it shows up

- The assessment is a consultant's spreadsheet that is stale before the first wave.
- Dependencies are discovered during cutover, which is when they cost the most.
- The regulator's exit plan exists on paper and has never been rehearsed.

## How it works

- 1

**Step 1**  
On-prem workloads are discovered via the Edge Agent and auto-classified with their dependencies.
- 2

**Step 2**  
A 6R assessment scores each workload for cost, effort and blockers.
- 3

**Step 3**  
Workloads are cut into dependency-aware waves; Whale AI drafts the sequence and flags risks.
- 4

**Step 4**  
Waves are rehearsed and approved against the unified inventory, with rollback plans attached.
- 5

**Step 5**  
Execution hooks (in progress) hand each wave to tooling and track it back on the board.

## What is included

- Auto-classification of on-prem workloads
- 6R assessment with cost, effort & blockers
- Dependency-aware wave planning with rollback
- Whale AI migration guidance

## Modules involved

|                                                                                                   |                                                                                                          |

| <b>Migration Engine</b><br>6R assessment, rehearsed waves & rollback for cloud migration.         | <b>Inventory &amp; Discovery</b><br>A live, unified map of every asset — across every cloud and on-prem. |
| <b>Cloud Connectors</b><br>One control plane over six public clouds, plus private, hybrid & edge. |                                                                                                          |

## Editions and audience

Recommended editions: Enterprise and Telco & Datacenter.

Who it is for: CIOs and Heads of Infrastructure running data-center-exit and cloud-migration programs.

## Delivered engagement — Two leading banks, Singapore & Qatar

Two banks running public cloud, private infrastructure and on-premises systems under MAS and Qatar central-bank supervision moved from weeks of manual evidence assembly per inspection to reports generated from one policy layer — and rehearsed the exit plans they had only ever documented.

*“The last supervisory request took three days. Before, it took three weeks of five people pulling screenshots. And the exit plan has now been run as a drill, with the evidence filed.”*

Chief Compliance Officer, Two leading banks, Singapore & Qatar — as reported by the customer

## Questions teams ask in the evaluation

### 01 Does the platform move the workloads?

Assessment, dependency mapping and wave planning are live. Execution hooks that hand the move to tooling and track it back are in progress; until then teams execute with existing tooling against the plan.

### 02 Can it satisfy a regulator's exit-plan requirement?

That is how BFSI customers use it: the exit annexure becomes a dependency-mapped, rehearsed plan with drill evidence the supervisor can read.

### 03 What does the assessment need from us?

An Edge Agent per site with read access to the hypervisor. Interviews fill in what discovery cannot see — business criticality, licensing constraints, change windows.
