

BlueWhale Stack for Government

Sovereign cloud operations — air-gapped where the mandate requires it.

September 2026 · Version 1.0 · BlueWhale Stack · www.bluewhalestack.com

BlueWhale Stack lets national and state governments run cloud, on-prem and hybrid estates from one control plane inside their own borders.

BlueWhale Stack lets national and state governments run cloud, on-prem and hybrid estates from one control plane inside their own borders. The Government Edition — generally available today — deploys fully air-gapped with an offline update channel, FIPS-validated cryptography, a WORM-backed audit log, always-on privileged access management and in-region AI, so residency and accreditation evidence are properties of the architecture.

Air-gapped Deployment class with offline updates and no call-home	FIPS Validated cryptography throughout
WORM Immutable, append-only audit log	In-region Whale AI on local models only

The regimes, and the control that answers each

Regime	What it demands	The control that answers it
National data-residency law	Data, inventory and audit records stay inside the border, provably	In-country deployment classes; residency enforced per resource and evidenced from the audit log
Security accreditation (FedRAMP / IRAP / StateRAMP-style)	Control evidence assembled to an accreditation framework	Compliance pack export from the WORM-backed audit trail; FIPS-validated crypto
Air-gap mandates for classified estates	No outbound connectivity, controlled update path	Air-gapped deployment class with signed offline update bundles
Privileged-access rules	Every administrative session attributable and reviewable	PAM always-on with session recording; MFA mandatory on every role

What Government teams get

- Deploy fully air-gapped: signed offline update bundles, no outbound connectivity, no call-home
- Keep data in-country — residency is enforced per resource and evidenced from the audit log
- Harden access with always-on PAM, session recording and MFA mandatory on every role
- Run Whale AI on in-region models only, so prompts and documents never leave the jurisdiction
- Connect sovereign clouds — AWS GovCloud, Azure Government, Google Distributed Cloud and national clouds — through the same connectors
- Export compliance packs for FedRAMP-, IRAP- and StateRAMP-style accreditation from the WORM-backed trail

Use cases

Sovereign, air-gapped governance across agencies Run an air-gapped Government Edition deployment with no outbound connectivity and an offline update channel, unifying inventory, identity and governance across agencies through a single control plane — directorates segregated, policy central. Modules: Sovereign Operations, Identity & Access, Inventory & Discovery.	In-country data residency with in-region AI Pin workloads, inventory and audit records to an in-country region, with Whale AI Abyss on in-region models and no call-home — intelligence that never leaves the jurisdiction. Modules: Inventory & Discovery, Whale AI.
Hardened privileged access PAM is always on with session recording, MFA is mandatory on every role, and identity federation maps your directory to platform roles — privileged access is provably controlled. Modules: Identity & Access, ITSM.	Accreditation evidence on demand Every action lands in a WORM-backed audit log; compliance pack export assembles the evidence for FedRAMP / IRAP / StateRAMP-style accreditation, with ITSM change control (P0-P4 SLAs) behind it. Modules: Cloud Audit & Evidence, ITSM.

Edition: Government

Sovereign by architecture. Sovereignty demonstrated, not asserted. Priced per operator or contract.

Delivered engagement — Defence & Interior ministries, Middle East

Two ministries with disconnected, air-gapped estates across many directorates deployed the Government Edition fully in-country, put every directorate under one security baseline and central policy, and began answering audit queries from a system of record in minutes.

Air-gapped Every sensitive estate	1 Security baseline, all directorates	Minutes Audit query response
---	---	--

“An audit query used to take days, directorate by directorate. It is now answered from one system of record in minutes — and the residency and segregation evidence is in the architecture itself.”

Head of IT Security, Defence & Interior ministries, Middle East — as reported by the customer

Procurement, hosting and integration questions

- 01

How is the platform procured for government?
Through tender or empanelment on 3–5 year fixed-bid terms, directly or via an accredited implementation partner. The Government Edition is priced as the Enterprise base plus the sovereignty layer.
- 02

Where does it run?
On sovereign on-prem infrastructure, in a private government cloud, or at government edge sites — fully air-gapped where required. Sovereign hyperscaler regions connect through the same connectors.
- 03

Does Whale AI need internet access?
No. The Government Edition runs Whale AI Abyss on in-region models inside the perimeter with zero external calls.

Platform certifications

ISO/IEC 27001:2022, ISO/IEC 27017, ISO/IEC 27018, ISO/IEC 27701 and ISO 22301, independently audited by accredited bodies; a CSA STAR Level 1 self-assessment, a GDPR compliance assessment and a SOC 2 Type II readiness assessment. Certificates and verification numbers are in the Trust Center.
