

PRODUCT OVERVIEW • WITH 3D PRODUCT ARCHITECTURE VIEW

BlueWhale Stack

Digital Experience Platform — One Platform. Every Industry. Every Estate.

One control plane for every cloud an organization runs — public, private, virtualization, hybrid stacks and edge. This overview presents the product in one document: what it is, the 3D architecture view of how it is built, the nine capability families inside it, the four editions it ships in, and how to see it running on your own estate in ninety days.

54 capabilities

9 families

4 editions

6 platform classes

What BlueWhale Stack Is

Modern organizations run many estates — public clouds, private datacenters, virtualization farms, hybrid stacks, remote and air-gapped sites. Each arrives with its own console, its own identity, its own bill and its own audit story. BlueWhale Stack replaces that sprawl with **one governed layer**: a single console, one identity fabric, one policy engine and one explainable bill across everything — with a multi-tenant Digital Experience Layer on top that lets operators and enterprises publish governed services to their own customers and business units.

The change is not another tool in the estate — it is the layer that makes the estate answerable.

54

capabilities shipped across the platform

9

capability families under one console

4

editions on one architecture — upgrade is a licence change

6

platform classes managed — public, private, virtual, hybrid, sovereign, edge

Who it is for

Enterprises

Multi-cloud and hybrid estates that need governance, cost discipline and audit evidence — without slowing delivery.

Telco & DC operators

Sell governed cloud services on your own capacity — white-label, metered, billed through your BSS.

Government & regulated

Sovereignty by architecture — in-country, segregated, air-gap-capable, with AI that never leaves the perimeter.

The one-line answer to “why now”: estates are multiplying faster than governance. BlueWhale Stack makes governance the layer that arrives first — not the retrofit that arrives after the audit.

The Architecture, Top to Bottom

The platform in one picture — read top-down, the way value flows.

How to read the architecture

Layer	What it means for you
1 • Industry segments	Enterprise, datacenter, telco, government and SMB consume governed services — each through its own edition of the same platform.
2 • Digital Experience Layer	Multi-tenant by design: white-label portals, catalog & marketplace, self-service, per-tenant metering & billing, SLA and tenant health — the layer your customers and business units see.
3 • Unified Platform Core	Nine capability families under one console, one identity, one policy and one bill — the governance engine of the whole estate.
4 • Integrations	The platform plugs into what you already run — OSS/BSS, ServiceNow/Jira, billing and invoicing, identity & SSO, and an API surface for everything else.
5 • Every estate	Public clouds, private and virtualization estates, hybrid and sovereign stacks — discovered, governed and billed as one, down to air-gapped and edge sites.
6 • Deployment modes	SaaS, BYOC on your own clouds, on-premise, sovereign air-gapped, or at the edge — the same product in every mode.

What Lives in the Platform Core

Management & Delivery

Provisioning, landing zones, blueprints and day-2 operations — delivery with governance built in.

Whalenomics · FinOps

Budgets, forecasts, chargeback and continuous optimization — spend decomposed to workload, department or tenant.

Security & Identity

One identity fabric (SAML/OIDC), least-privilege access, continuous scanning — uniform posture everywhere.

Governance & Audit

Policy as configuration; controls monitored continuously; examiner-grade evidence on demand.

Whale AI — incl. offline

AI for operations, documentation and compliance — your choice of model, able to run fully inside the perimeter.

Migration & Discovery

Inventory, dependency mapping and rehearsed waves with rollback — entry, movement and exit industrialized.

Observability & ITSM

Health, events and service operations — integrated with ServiceNow, Jira and existing tooling.

Tenancy & Monetization

Native multi-tenancy, catalogs, marketplace, per-tenant metering and billing feeds.

Sovereign Operations

In-country deployment, segregation, air-gapped classes and offline-tolerant edge.

Full capability list (54 capabilities with edition mapping) available in the technical datasheet on request.

How the families work together — three everyday moments

A new estate lands

Migration & Discovery inventories it; Security & Identity extends the identity fabric; Governance applies policy; Whalenomics baselines cost — governed from day one, not retrofitted.

The auditor calls

Governance & Audit has been collecting evidence continuously across every estate — the supervisory request becomes report parameters, not a war room.

AI, inside the walls

Whale AI reads operations and documentation on the customer's own model, inside the perimeter — with Observability watching it and Audit logging it.

The design rule behind all nine: every family reads from and writes to the same inventory, identity and policy plane — which is why one console can answer questions that previously took four tools and a spreadsheet.

Four Editions, One Architecture

Standard

Governed cloud for a single estate

WHO IT TARGETS

Mid-market and single-cloud enterprises

WHAT IT INCLUDES

- Management & Delivery
- Whalenomics essentials
- Security baseline & observability

THE OUTCOME

Governance from day one — not a retrofit.

Enterprise

The full platform, BYOC across every estate

MOST DEPLOYED

WHO IT TARGETS

Multi-cloud enterprises, BFSI, regulated industries

WHAT IT INCLUDES

- All nine capability families
- Whale AI — including offline
- Cloud Audit & Migration Engine

THE OUTCOME

Every estate answerable from one console.

Telco & Datacenter

Operators become cloud providers

WHO IT TARGETS

Telcos, datacenter & hosting operators

WHAT IT INCLUDES

- Tenancy & Monetization
- White-label portals & catalog
- OSS / BSS & billing integration

THE OUTCOME

Revenue per tenant, on capacity you own.

Government

Sovereign by architecture

WHO IT TARGETS

Ministries, agencies & public sector

WHAT IT INCLUDES

- Sovereign Operations
- Air-gapped deployment classes
- State-audit evidence & segregation

THE OUTCOME

Sovereignty demonstrated, not asserted.

One architecture: an upgrade is a licence change, not a migration. Commercial details are shared in the discovery workshop.

Included in every edition

One console

Every estate, one pane of glass.

One identity

SAML/OIDC fabric across everything.

One policy

Governance as configuration.

One bill

Spend explained, decomposed, owned.

API-first

Everything the console does, the API does.

Deployment — the same product, wherever it must run

SaaS

Fastest start — running in days, with regional residency options.

BYOC — Your Clouds

On your own cloud accounts — nothing re-hosted to adopt it.

On-Premise

Full control inside your own datacenters.

Sovereign · Air-Gapped

Fully disconnected operation — including Whale AI offline.

Edge — Offline-Tolerant

Plants, branches and bureaus under HQ-grade policy.

Every mode runs the same platform build — moving between modes is an operational decision, not a re-implementation. Mixed estates (SaaS console governing air-gapped and edge sites through the Edge Agent) are the norm, not the exception.

Certified, and Proven Before Commitment

Independently certified

ISO/IEC 27001:2022

Information security management — certified by LMS Assessments.

ISO 22301:2019

Business continuity management — certified by AMERICO QSR.

ISO/IEC 27017 & 27018

Cloud security and cloud privacy controls — certified by SNS Certification.

ISO/IEC 27701:2019

Privacy information management — certified by Staunchly MSS.

GDPR & CSA STAR L1

GDPR alignment and Cloud Security Alliance STAR Level 1 — SNS Certification.

SOC 2 Type II

Readiness assessed — Trust Services Criteria.

Certified entity: BlueWhale Stack Consulting and Technologies FZE LLC. Certificates are verifiable through the Trust Center at bluewhalestack.com.

Support & service model

Tiered support

L1/L2 with the customer or partner, L3 with BlueWhale — 24x7 critical bridge at 99.9%.

Implementation

BlueWhale practices — App, Infrastructure and Data Modernization, AI Design — or certified partners.

Product & roadmap

Quarterly releases; customer councils feed the roadmap; no forced upgrades on sovereign estates.

The 90-day prototype — the standing offer

Next step — the discovery workshop. Half a day with your technology and finance leaders. Bring your hardest audit finding and your least explainable cloud bill; we will show what the platform does with both, on your estate's shape, before any commercial conversation.
