

WHITE PAPER • FOR GROWING ORGANIZATIONS

BlueWhale Stack Standard Edition

Enterprise-grade cloud visibility, governance and cost control — sized, priced and paced for organizations of 5 to 500 people.

The Standard Edition, in Brief

BlueWhale Stack is a unified, vendor-neutral Cloud Management Platform delivered in four purpose-built editions — the same engine, packaged to how each buyer is regulated and operated. This paper describes the **Standard Edition**: who it serves, the problem it removes, what it contains, and how organizations evaluate it on their own estate.

Who this edition serves

IT leaders and founders at growing organizations — technology and SaaS firms, retail and e-commerce, professional services, mid-market manufacturers and education providers — running one to three clouds without a dedicated cloud platform team.

1-3  clouds in a typical growing estate — each with its own console	30%+  of cloud spend commonly wasted on idle and oversized resources	0  dedicated platform engineers in most mid-market IT teams	Days  to first value — the standard this edition is built to
---	--	---	--

One platform, four editions: Standard for organizations that consume cloud · Enterprise for those that govern it at scale · Telco & Datacenter for those that sell it to tenants · Government where it must never leave the perimeter. Capabilities are built once and shared — an edition is a fit, not a feature tier.

The Mid-Market Squeeze

Growing organizations live a specific paradox: they adopted cloud precisely because they could not afford heavy infrastructure teams — and now the cloud itself demands one. Resources multiply across a couple of providers; nobody is quite sure what runs where; the monthly bill arrives as a surprise; and the security questionnaire from that first enterprise customer asks questions the current tooling cannot answer.

The enterprise answer — a platform team, a toolchain, a six-month rollout — does not fit. What fits is a platform that behaves like a member of the team: discovering everything automatically, applying sensible guardrails by default, and answering the three questions that matter — **what do we have, what does it cost, and is it safe** — from one screen, from week one.

The test any platform must pass: neutrality across every environment · completeness across the lifecycle · deployability wherever law and workload require · and fit to how this specific buyer is regulated and operated. Tools pass one or two of these; the remainder of this paper shows how the Standard Edition passes all four.

Architecture — Where the Standard Edition Sits

BlueWhale Stack reads as four layers. The diagram below shows the platform with the Standard Edition in position — the same shared engine, packaged to this buyer.

Layer 4 — Industry Outcomes served by this edition

Technology & SaaS · retail & e-commerce · professional services · mid-market manufacturing · education

LAYER 3 — PURPOSE-BUILT EDITIONS (THIS PAPER'S EDITION HIGHLIGHTED)

Standard	Enterprise	Telco & Datacenter	Government
-----------------	------------	--------------------	------------

LAYER 2 — EIGHT SHARED PLATFORM MODULES (BUILT ONCE, INHERITED BY EVERY EDITION)

Unified Cloud Mgmt	Identity & Access	Tenant & Partner Program	ITSM Integration
Discovery & Assessment	Service Catalog	FinOps	Cloud Audit

FOUNDATION MODULES DELIVERED IN THIS EDITION

Identity & SSO	Cloud Connectors	Inventory	Provisioning
Compliance & Governance	Security Scanning	Audit Logs & Reports	Business Connectors

■ **Gold-bordered** = modules that decide this edition's evaluations · shaded = shared core every edition inherits

Layer 1 — The infrastructure this edition governs

Azure, AWS and Google Cloud accounts — the one-to-three-cloud estates growing organizations actually run — discovered automatically on connection.

Deployment topologies for this edition

SaaS Connected in hours; nothing to install or operate	5 accounts · 10 users Right-sized quotas with an in-place upgrade path	Partner-deployed Certified partners deliver onboarding in days
--	--	--

Reading the diagram: For this edition the architecture's promise is simplicity: connect accounts, and the platform assembles the estate map, applies guardrails and starts reporting — the layers do the work a platform team would.

What the Standard Edition Contains

Capability	What it delivers
Discovery & Inventory	Automatic discovery of every account and resource across clouds — the estate map most organizations have never seen.
Provisioning & Service Catalog	Approved self-service offerings with guardrails: the team moves fast inside policy, not around it.
Compliance & Security Scanning	Continuous scanning with vulnerabilities classified critical / high / medium; policy enforcement without a security department.
Cost Reports & Governance	Spend visibility by project and team, budget tracking and optimization recommendations — the surprise removed from the invoice.
Identity & SSO	Role-based access integrated with the identity provider already in use — including Azure Entra and Google Workspace.
Audit Logs & Reports	Evidence on demand for customer due diligence, insurers and auditors.
ITSM (basic) & Business Connectors	Requests and changes flow through existing lightweight processes.
Partner-Supported Onboarding	Delivered through certified partners — deployment in days with someone accountable on call.

Deployment & commercial model

SaaS delivery · up to 5 cloud accounts, 1,000 resources, 10 users · published flat annual licence · clear in-place upgrade path to Enterprise as the estate grows.

RUNS ACROSS

AND THE VIRTUALIZATION ESTATE

How This Edition Solves Its Industries

Technology & SaaS

The problem • Engineering teams create resources freely; security questionnaires from enterprise prospects go unanswered; the bill grows faster than revenue.

How the Standard Edition solves it • Automatic discovery and inventory; guardrailed self-service through the catalog; continuous security scanning; audit reports generated on demand.

Outcome • Enterprise-ready posture without an enterprise team — and the next security questionnaire answered from live reports.

Retail & E-commerce

The problem • Seasonal peaks demand elastic capacity; costs spike with campaigns and never quite come back down.

How the Standard Edition solves it • Cost forecasting before the season, per-project budgets during it, optimization recommendations after it — with provisioning standardized through the catalog.

Outcome • Peak capacity with a known price tag; post-season cleanup driven by data, not guesswork.

Professional Services

The problem • Client work spreads across accounts and projects; nobody can say what each engagement's infrastructure actually costs.

How the Standard Edition solves it • Project-level tagging, inventory and cost reporting — every engagement's footprint visible and attributable.

Outcome • Engagement margins that include the cloud line — priced and billed with confidence.

Mid-market Manufacturing & Education

The problem • Small IT teams inherit hybrid estates — a plant system here, a campus platform there — with no unified view.

How the Standard Edition solves it • One console across cloud and on-premises discovery; role-based access for distributed teams; compliance reporting for boards and regulators.

Outcome • A governed estate run by the team already in place — no new department required.

The Edition at Work

A SaaS company preparing for enterprise customers

Security questionnaires answered from live audit reports; access review and evidence in hours, not weeks.

An e-commerce retailer through peak season

Cost forecasting before the campaign, per-project budgets during it, optimization after it.

A services firm consolidating after acquisitions

Two inherited cloud estates discovered, inventoried and governed under one console in the first month.

Why it lands: Standard is deliberately not a cut-down demo of the platform — it is the full governance core, scoped to the estates growing organizations actually run, at a price that does not require a board discussion.

Field heritage

The platform productizes eight years of consulting across telecom, banking, government, healthcare, manufacturing and datacenter modernization — engagements across India, the GCC and beyond. The workflows in this edition are not imagined; they are transcribed from the sectors it serves.

Getting Started

Step	What happens	Typical duration
1 • Discovery workshop	Map the estate, the regulatory posture and the operating pain points; agree the prototype scope.	One week
2 • Working prototype	The Standard Edition deployed against the organization's real environments on a full-featured 90-day prototype licence.	Two to four weeks to first insight
3 • Evaluation on evidence	Capability scorecard, findings and a deployment recommendation — judged on the organization's own numbers.	Day 90 review

About BlueWhale Stack

Founded in 2018 as a cloud consulting firm, BlueWhale Stack Consulting and Technologies launched the BlueWhale Stack platform in 2026 — eight years of field experience, productized — delivered alongside consulting practices in Application, Data & AI and Infrastructure Modernization.

Region	Entity & registered office
United States	BlueWhale Stack Consulting and Technologies Inc • 221 W 9th St, PMB 1099, Wilmington, Delaware 19801
United Arab Emirates	BlueWhale Stack Consulting and Technologies FZE LLC • 26th Floor, Amber Gem Tower, Ajman • BC 892084
India	BlueWhale Stack Consulting and Technologies Pvt Ltd • 301, 3rd Floor, Ackruti Star (Innov8), Marol MIDC, Andheri (E), Mumbai 400093

Next step: request a discovery workshop or a 90-day prototype of the Standard Edition through your BlueWhale Stack representative or authorized partner.
